

Batchload

TO DO

- Every load table: Protect 934 from being overwritten @OV_PROTECT y(934:d)
- Every table: overlay double check with @ov_title=":4" (if watch, compare first 4 chars of titles - in not match - reject)
- Insert/update tables: protect BCODE3
- Every non-OCLC table: check incoming 001 to make sure it has a prefix. use %001(start="a-z")
- table for insert/update EBSCO ebooks (or any from OCLC)
- table for delete EBSCO ebooks (or any from OCLC) -
#map each 019 \$a to non-marc o tag so it can match
019||Ma|0|0|b|o|0|n|N|0|

Hi Wit,

Nice to hear from you!

The current manual does not mention these two triggers at all, so I assume that means that they are difficult and/or rarely used. I personally have never used them.

I have attached our internal documentation for all the ov_priority triggers since many are interrelated. I hope this is helpful.

Regards,

Patrick
